

Script 1 - Echo-back some information

Write a script name hello.sh that will take the user's first name as a command line argument and say hello!

Use Case: ./hello.sh Bob

Output: Hello Bob, I am a BASH script!

Script 2 - Make a C++ Header Comment

In all of your C/C++ assignments you'll have to include a header comment on the file. It will include your name, the date and a short description of the project or the contents of the file.

You should get the date from the 'date' command. The date should be in a mm/dd/yyyy format.

Create a script that uses a few command line arguments and the 'cat' command to output a C/C++ block comment that includes that information

Use Case: ./makeHeader.sh "John Doe" "This is my description"

Output:

```
/*  
Author: John Doe  
Date: 09/15/2020  
Description: This is my description.  
*/
```
